#### **Emotion in the Science Center:**

Applying Affective Theory, Research, and Technologies in Designed Experiences

ASTC 2019 Preconference Intensive September 20, 2019 – 9:00am-5:30pm Toronto, Ontario, Canada

Becki Kipling – Museum of Science, Boston (MOS)

Beth Malandain – MOS

Sarah May – MOS

Alana Parkes – MOS

Gabbie Schlichtmann – EdTogether

# Why Emotion?

## Why Emotion?

"without emotion, all decisions and outcomes are equal – people would have no preferences, no interests, no motivation, no morality, and no sense of creativity, beauty, or purpose... Emotions are, in essence, the rudder that steers thinking"

(Immordino-Yang, 2015, pp. 27-28)

## What is emotion?

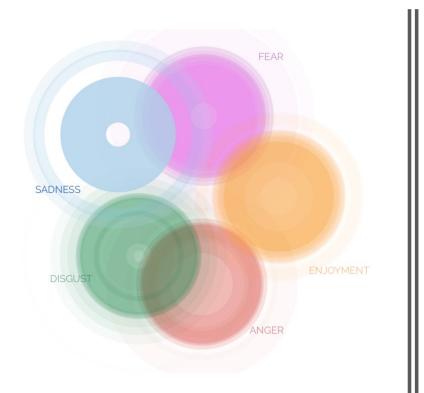

- What happens (relational content & situational content)?
- What is the main character(s) assessment or evaluation of the scenario (appraisal component)?
- Describe how you think the main character(s) feel (subjective component)?
- How does what the character(s) feels connect to what they do/express (action tendency component)?
- Describe the relationship between emotion and cognition in this scene?

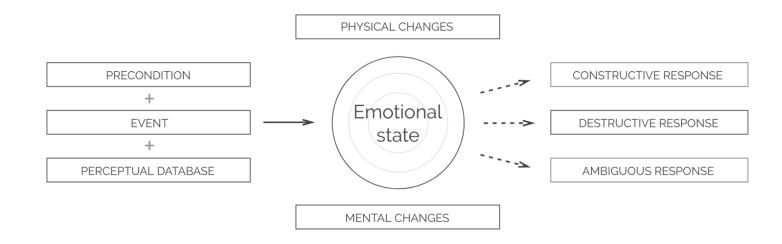

# The Nature of Emotion

### Diagnostic Features

#### your body becomes tense

you feel attacked

#### Emotions...

- Continuously experienced emerging from appraisals (evaluations) and interoception
- Socially learned and culturally sensitive
- Shared across human beings with some universal components
- Observable (physiological, facial, body movement and gesture, voice, social signals).
- Experienced consciously and subconsciously
- Mediate our relationship to the world
- Form the basis of other more complex social and emotional phenomenon like empathy, perspective taking, decision making, collaboration, self-regulation and motivation

## Break

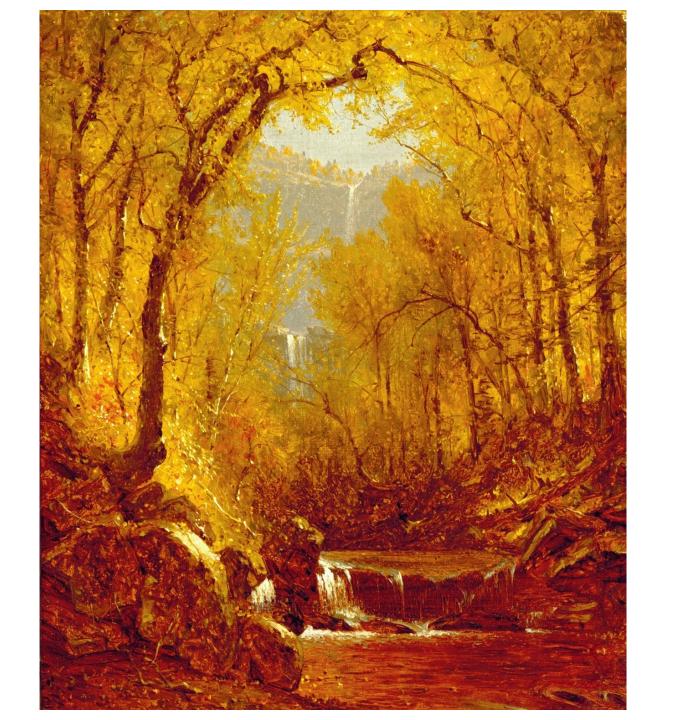

#### **Measurement of Emotions**

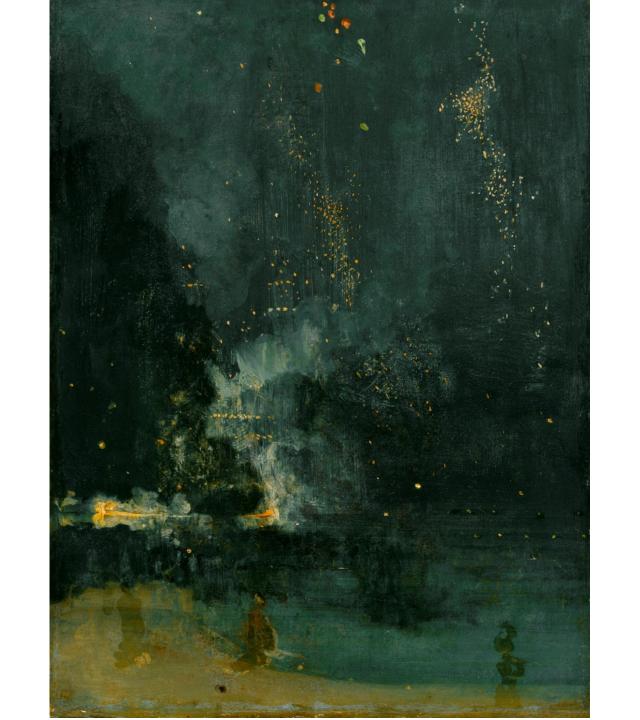

Sarah May shares an experience she had at the Detroit Institute of Arts, feeling inspired but also overwhelmed by the art experience there.

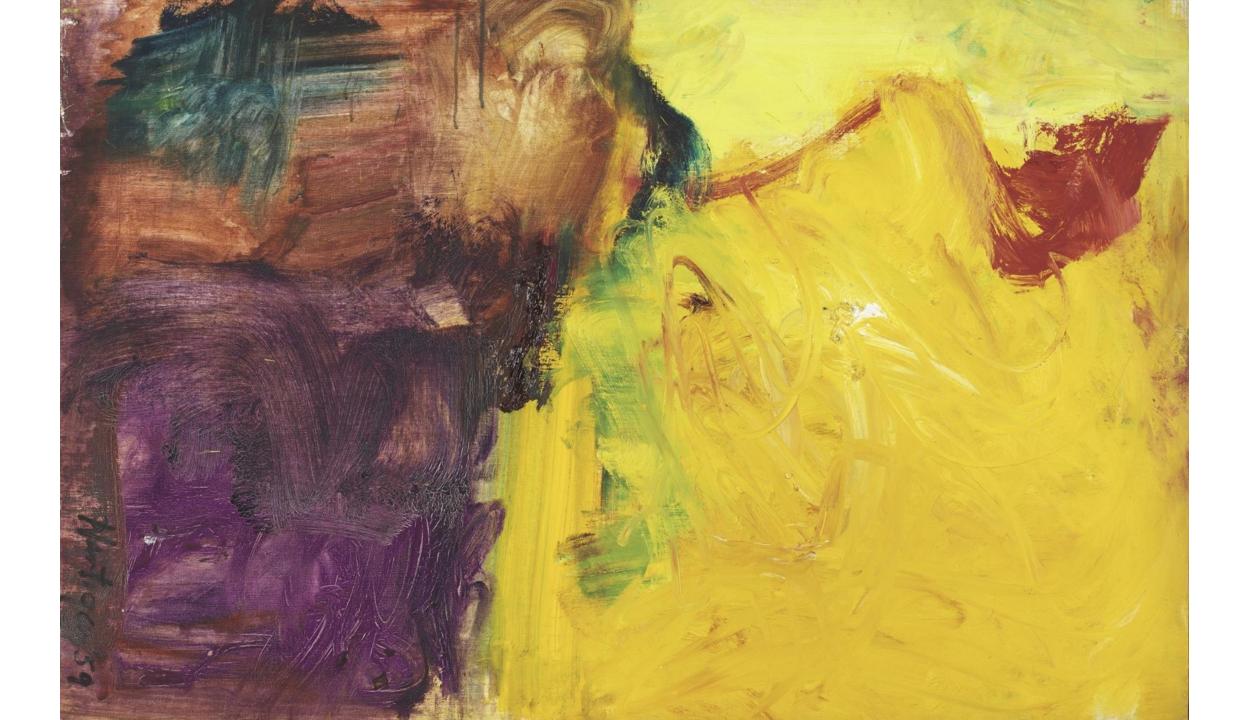

She uses this story to talk about evaluating a museum experience through an emotion lens.

All images retrieved from dia.org/

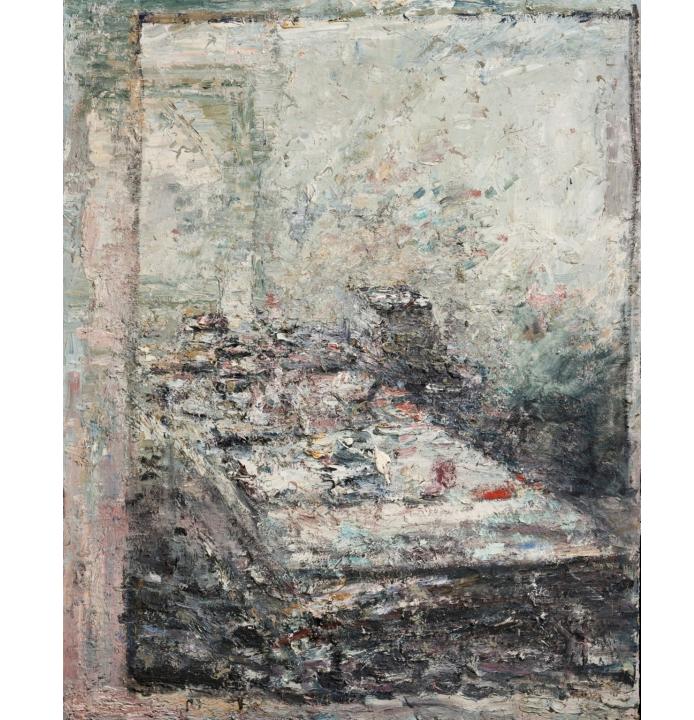

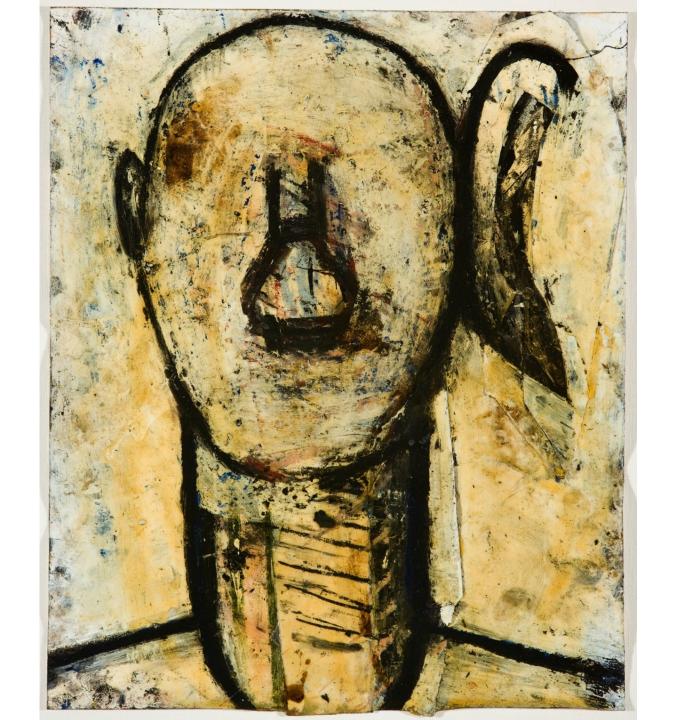

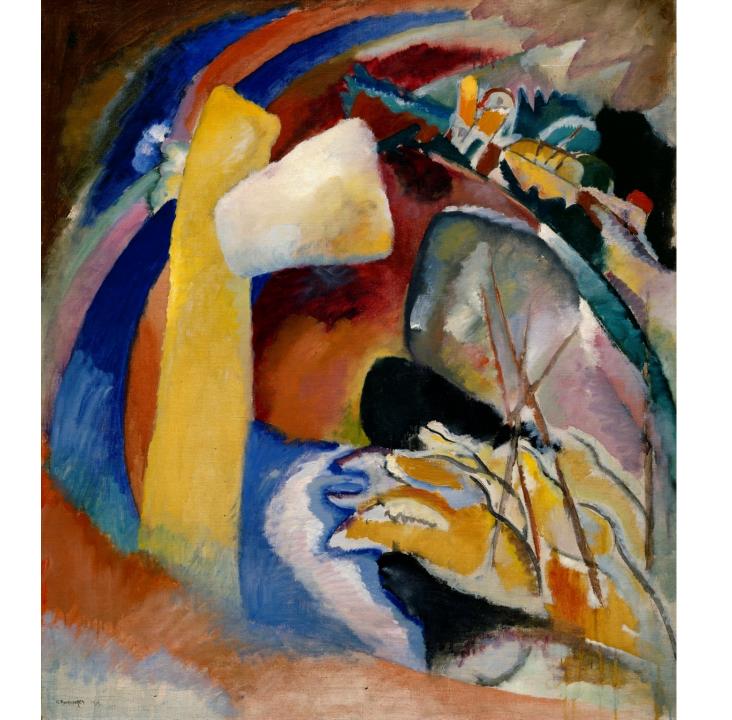

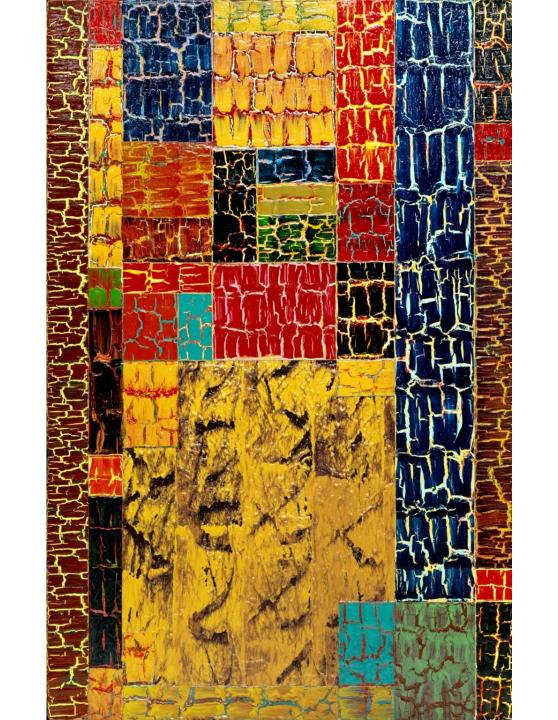

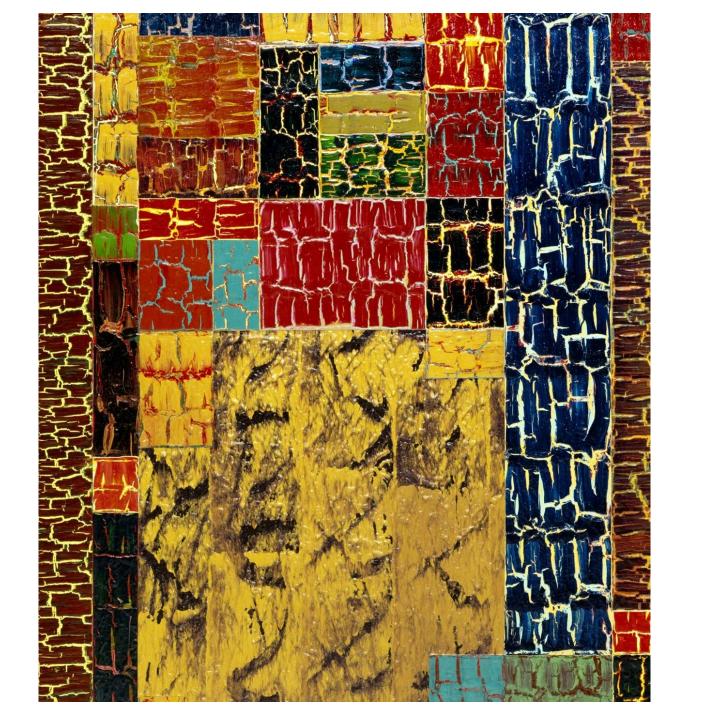

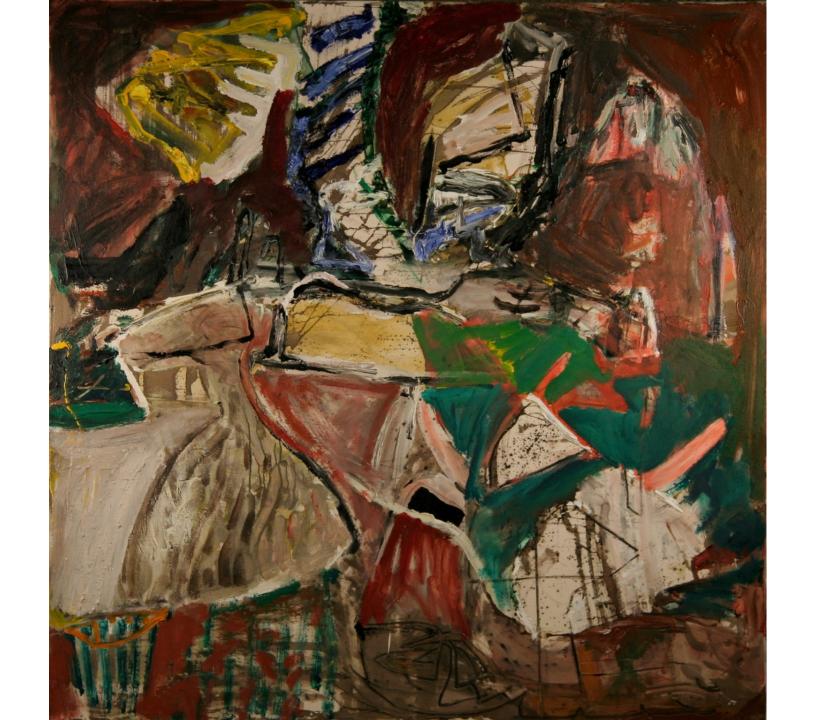

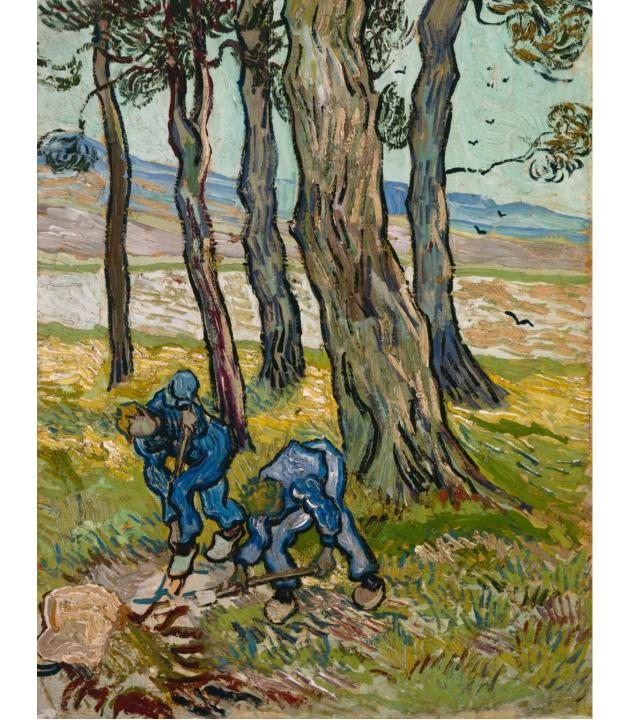

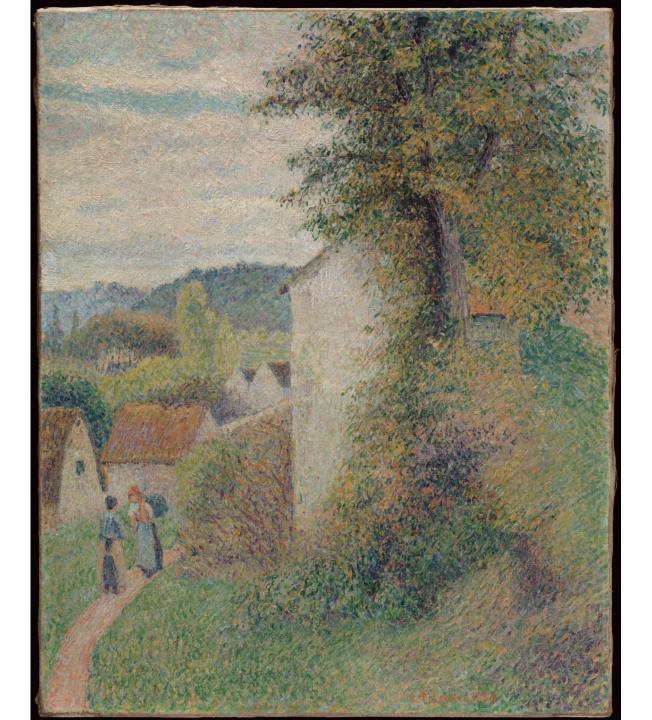

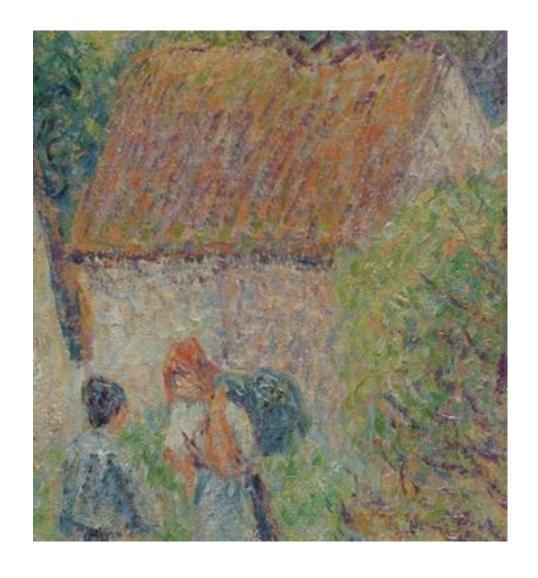

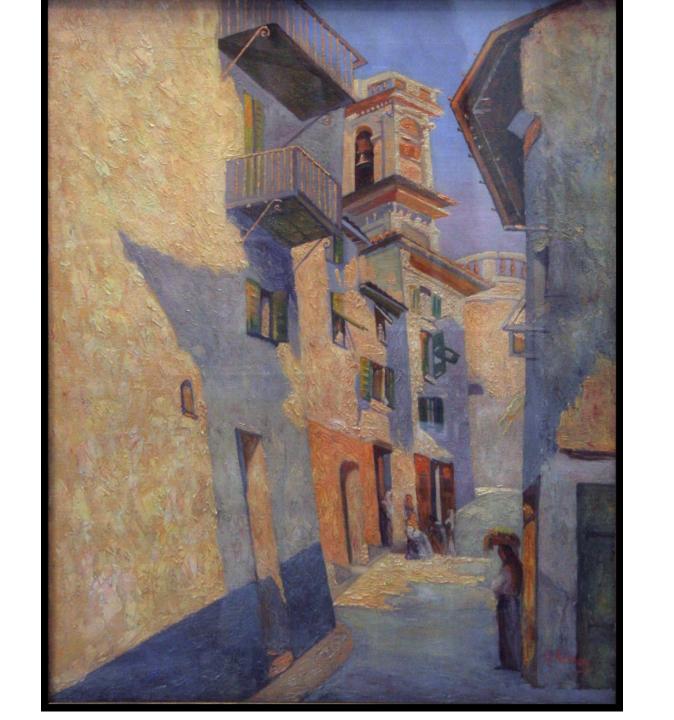

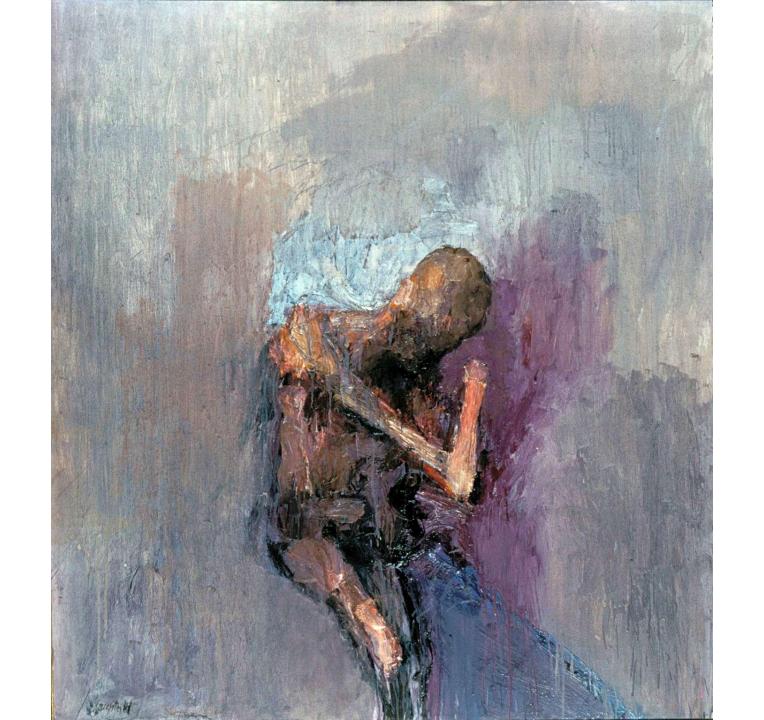

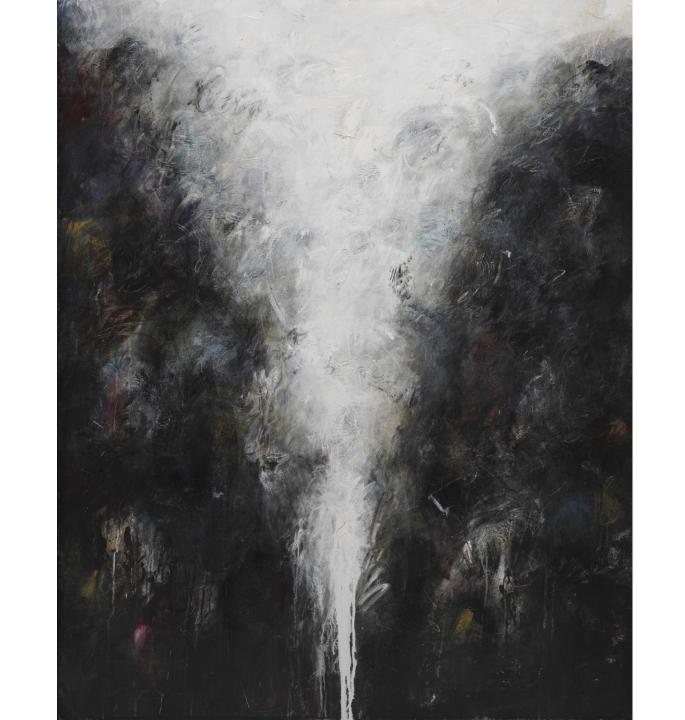

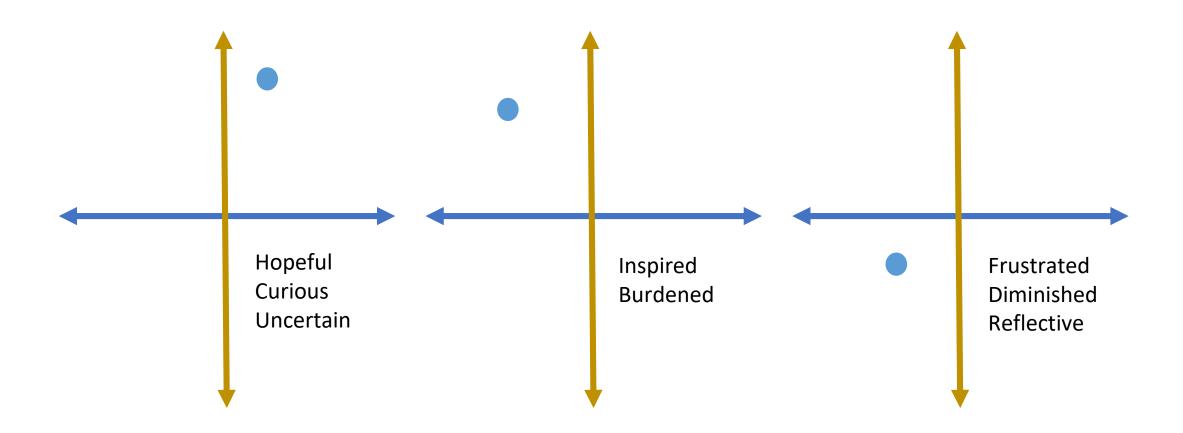

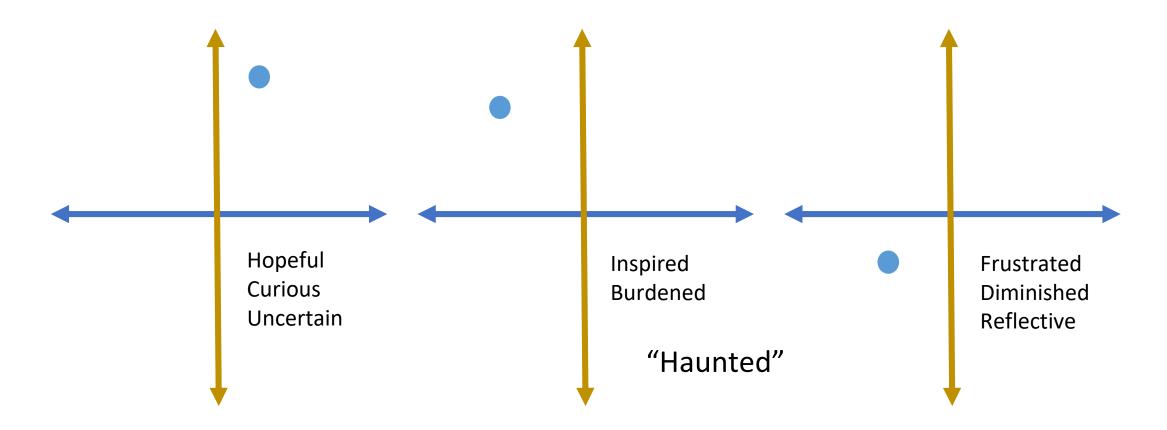

How can we richly <u>and rigorously</u> characterize the emotion experiences of our visitors?

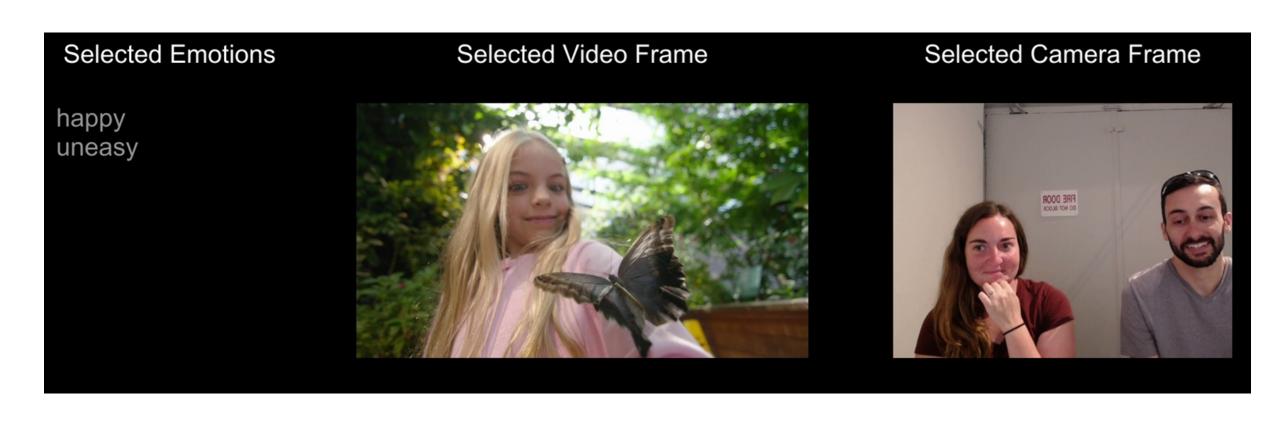

Overall: Stimulated but overwhelmed

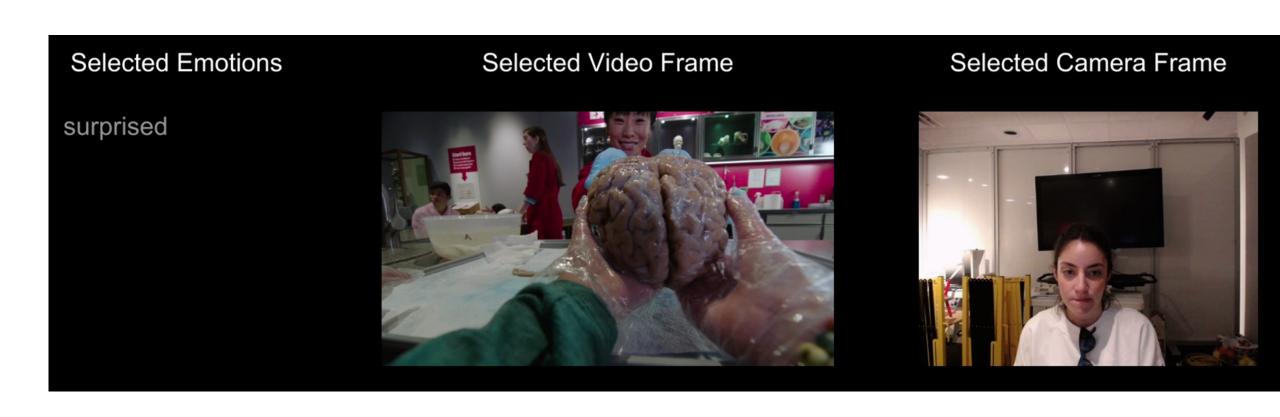

Overall: Stimulated but overwhelmed

# We can make (some) assumptions based on what we can observe...

# We can make (some) assumptions based on what we can observe...

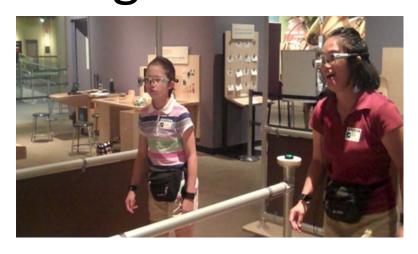

# We can make (some) assumptions based on what we can observe...

This visitors' facial movements varied depending on if he got an answer wrong:

- Jaw dropped 40% more than if he got it right
- Smiled 10% less

## We can measure (some) subconscious changes...

Heart rate

Eye movements (attention)

Electroencephalograph (Brain waves)

We can relate emotions to events and behaviors...

### **Epistemic (knowledge construction)**

#### **Achievement**

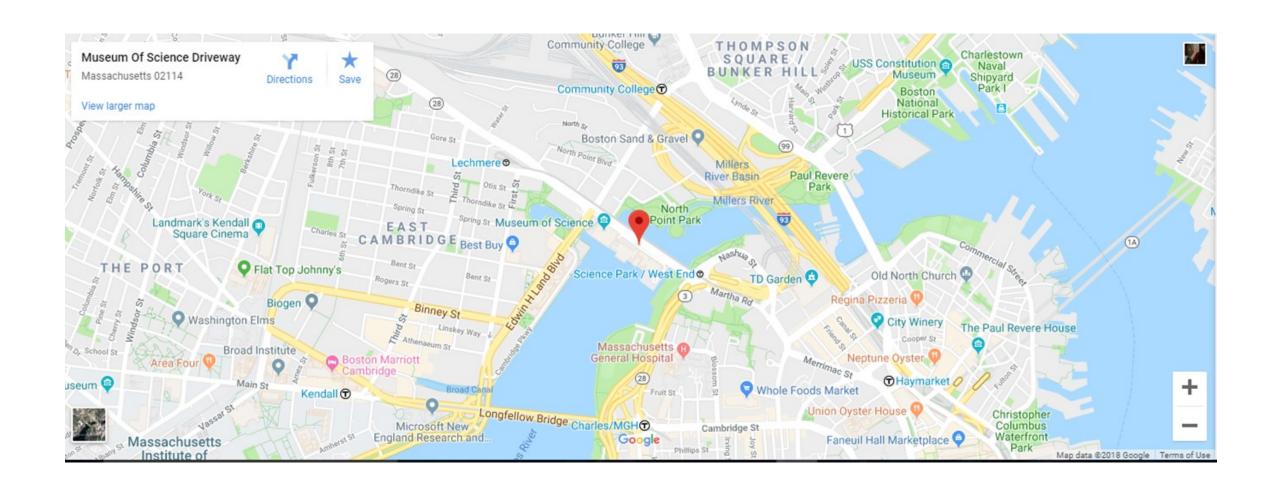

#### **Social**

### **Topical – content and experience**

#### Incidental

Scaling Shapes!

Think about your experience with the Scaling Shapes activity.

Interview your neighbor about their experience...

In-depth data exploration with volunteers...

#### Share out:

- What was it like to reflect on your experience through an emotion lens?
- In what ways were the different questions and measures able to capture something important about your experience?
- Where did they miss the mark?
- Did these interview questions prompt any deeper conversations or new insights?

# A final note: Emotion reflection as intervention

### Were there any ideas about emotions that you think the museum was trying to communicate through this activity?

P1: "I guess it's like, I notice sometimes when I come here that, depending on if you're here for an hour or if you're here a lot longer, you'll start to rush through more things. You sometimes come in to see the things you want to see and the rest of it you're kind of like, look at it and go ... It would be kind of cool actually, if you go through the whole Museum, if we had something to indicate, 'How did you feel at this exhibit? How did you feel walking through the halls?' To show what people are feeling as they go through the museum."

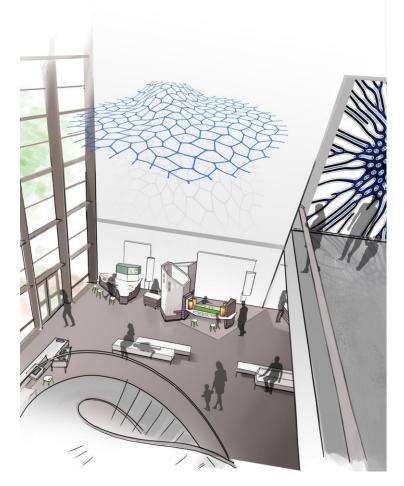

P2: "For me, what I would have thought about after the activity is thinking about stopping more, actually taking in stuff instead of just like rushing through. But also ... like how people use their emotions to express what they're feeling to people in general..."

## Design with Emotion in Mind

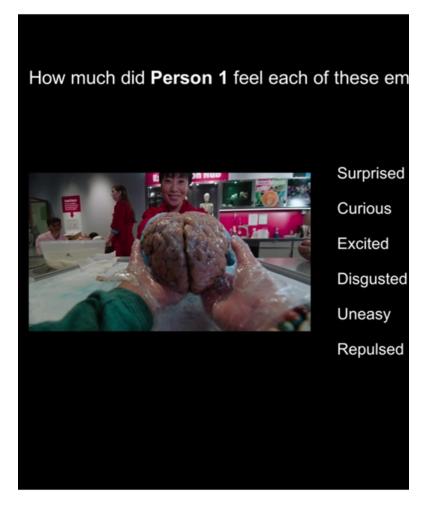

## Evolution of Emotion Thinking

at the Museum of Science, Boston

#### **Designing for Emotion**

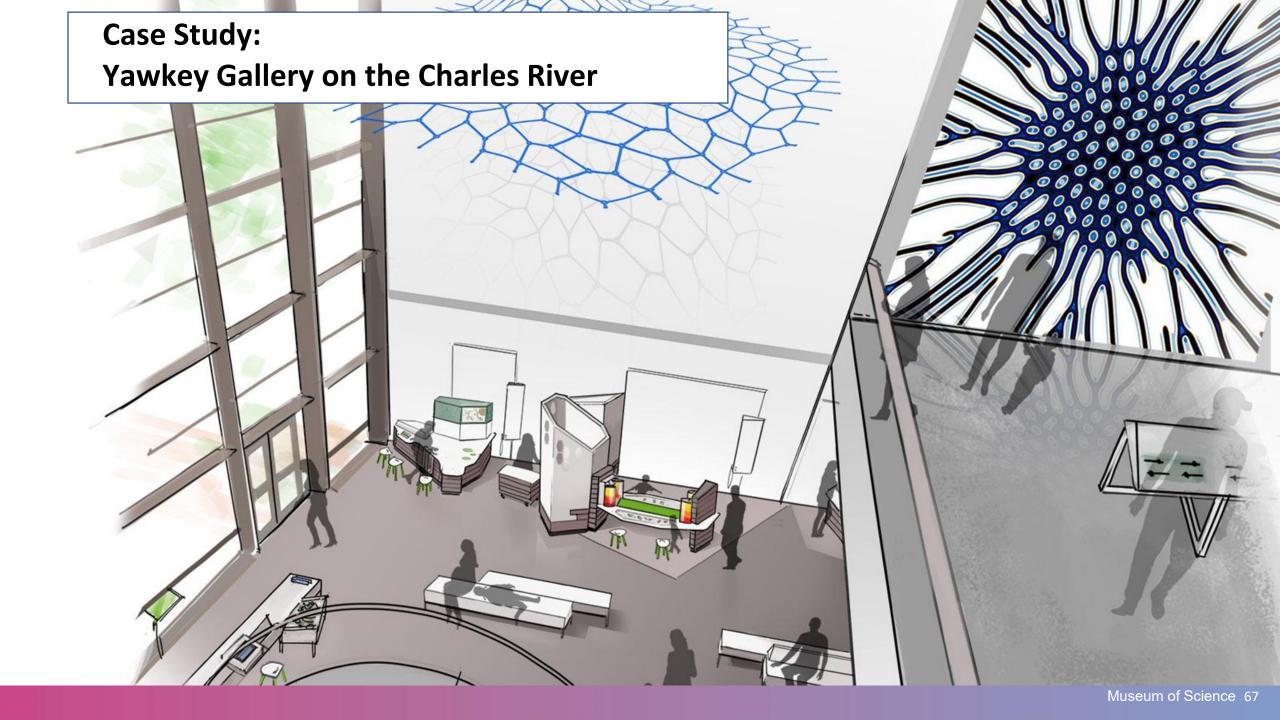

Gallery

Component

Educator/Program

#### Yawkey Gallery Goals and Messages

#### Main message:

The natural and engineered worlds interact together as one.

#### Goals:

- **1. Visitors will engage in observation activities** to interpret the interactions between the natural and engineered parts of the Charles River.
- **2. Visitors will engage in engineering design process activities** and test the impacts of their engineering decisions to solve problems encountered by scientists and engineers in the Charles River.
- **3.** Visitors will be inspired to think about the connections between the natural and engineered parts of systems present in their everyday lives.

#### **Reflective Spaces**

APE (Active Prolonged Engagement) Activities

### Productive Struggle

An NSF-funded Design-based research project to investigate the emotional state of "productive struggle"

### Productive Struggle

### Project tasks:

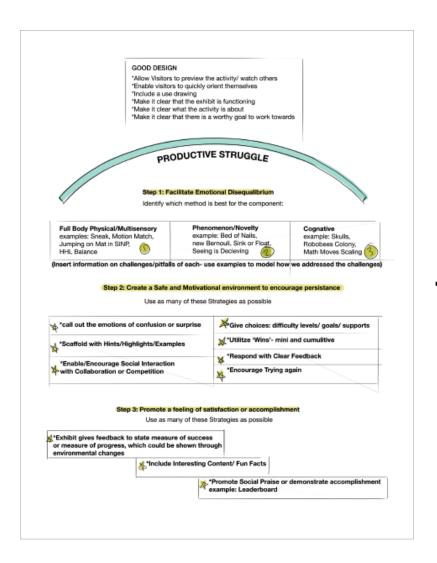

- Develop a theoretical model for productive struggle
- Revise two existing activities and create one new one to support productive struggle
- Develop a set of design guidelines and strategies

### Productive Struggle

### Elements of Productive Struggle:

- High activation
- Self-reported productivity
- Self-reported struggle
- Progress towards a goal

### Working on the design framework

### **Productive Struggle Draft Design Framework**

Productive Struggle is an experience when a learner engages with disequilibrium in order to navigate a challenging task and achieve a satisfying resolution. Disequilibrium is a sense of imbalance—which can be experienced as confusion. frustration, surprise or unease-that is brought on by a physical, cognitive, or social challenge. This document shares evidence-based approaches for designing museum exhibits that support Productive Struggle.

### STEP 0: Allow visitors to quickly orient to the task so they don't spend too much of their "struggle budget" figuring out what to do

- . Clearly identify what the activity is about and that it has a clear goal worth working towards.
- · Allow visitors to watch others (preview the activity).
- . Include a use drawing/video
- . Clearly indicate that the challenge is intentional and not a result of a broken exhibit.

### STEP 1: Facilitate disequilibrium

Identify which approach is best for the activity

### Physical/Multisensory Challenge The disequilibrium may come from

the challenge of using your body in a new or difficult way, such as slowly sneaking up on a bird or balancing on of air) or a difficult task (such as a board. Challenges might involve fine and/or gross motor skills.

### Cognitive Challenge

Visitors puzzle over surprising phenomena (such as the Coanda effect that causes a ball to hover in a stream doubling the volume of a 3D shape). Consider having visitors figure out hidden concepts or make a guess with partial information.

### Social Challenge

nteractions with other people bring on disequilibrium through competition, social pressures of performance, or a task that highlights disagreements between visitors. Disequilibrium can also arise from being alone.

### STEP 2: Create a safe and motivational environment for persistence

Use as many strategies as possible towards as many goals as possible

### Some strategies:

- · Normalize feelings of
- disequilibrium. Provide opportunities to
- acknowledge and reflect on disequilibrium.
- · Encourage supportive social interaction.

### Goal: Reinforce a sense of autonomy Some strategies:

- · Give choices of levels, supports, goals, and types of social interaction (competition or collaboration). Have multiple solutions.
- Be able to skip or retry challenges.

### Some strategies:

- · Allow for mini-wins as interim steps are completed.
- Make it clear when success and failures occur and what causes
- · Offer scaffolding or hints.
- · Encourage trying again.

### STEP 3: Promote a feeling of satisfaction or accomplishment

Use as many strategies as feasible

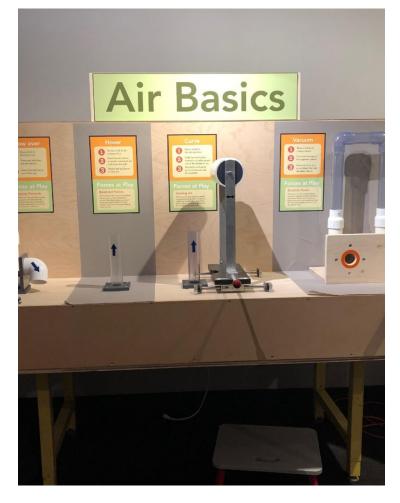

- Provide feedback that indicates successful progress and completion of the activity.
- . Allow visitors to demonstrate their accomplishment (via a leaderboard, environmental changes, etc.).
- . Completion yields a new insight about oneself or about the subject matter.
- Use interactive and multisensory exhibit elements

### **Exhibits featuring productive struggle**

Sneak

Mystery Skulls

Air Prototype

**Emotional Engagement during Live Presentations** 

What would a museum visit look like if educators could "tune in" to the needs, interests, and engagement levels of each visitor?

What if educators already are, but we just haven't figured out how to see it?

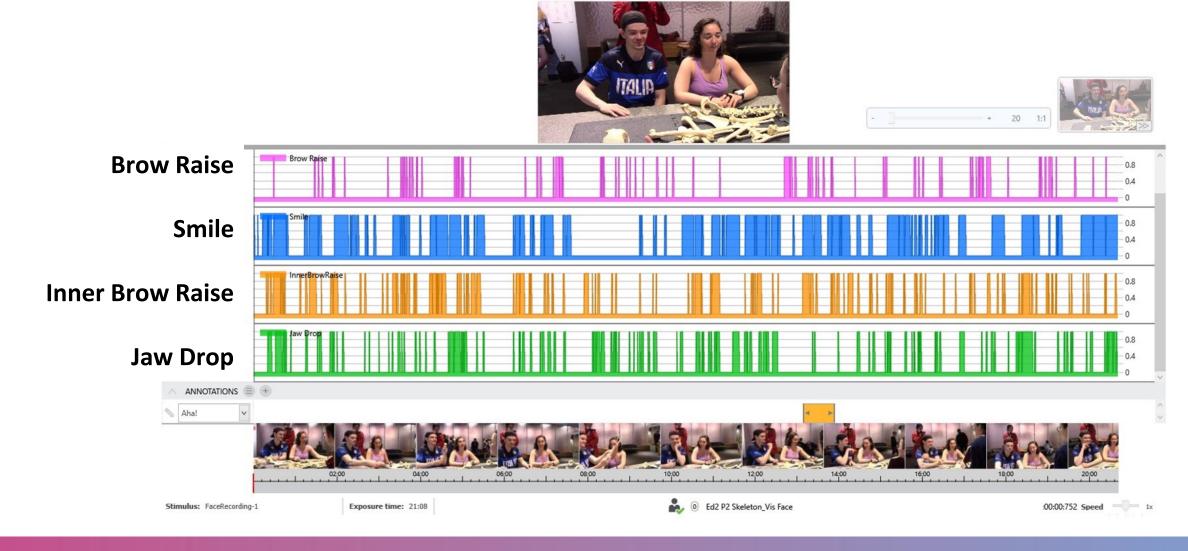

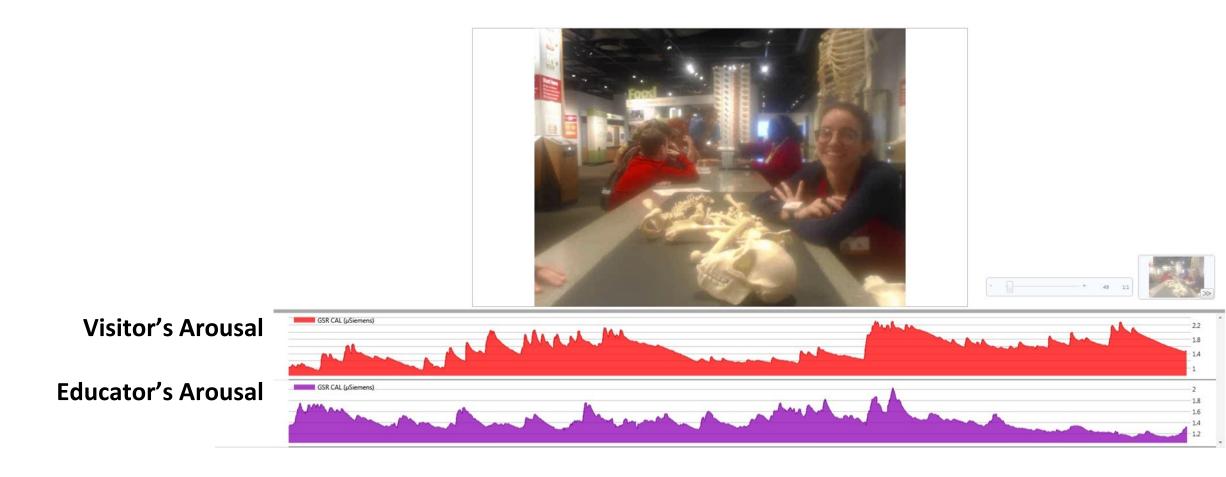

### Affective data collected...

### Affective data collected...

### Affective data collected...

"How in tune did you feel?"

"Tell me about emotions you felt along the way."

"How do you think the educator played a role in what you were feeling?"

### What did we learn?

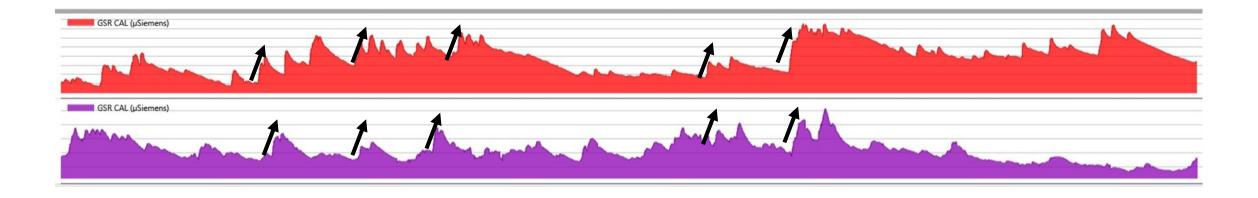

**Visitor**: "I felt very connected... the educator went with what we were going with... the flexible structure helped."

**Educator**: "It was one of my best programs... the visitor had a goal in mind, they were curious, and were very excited."

### What did we learn?

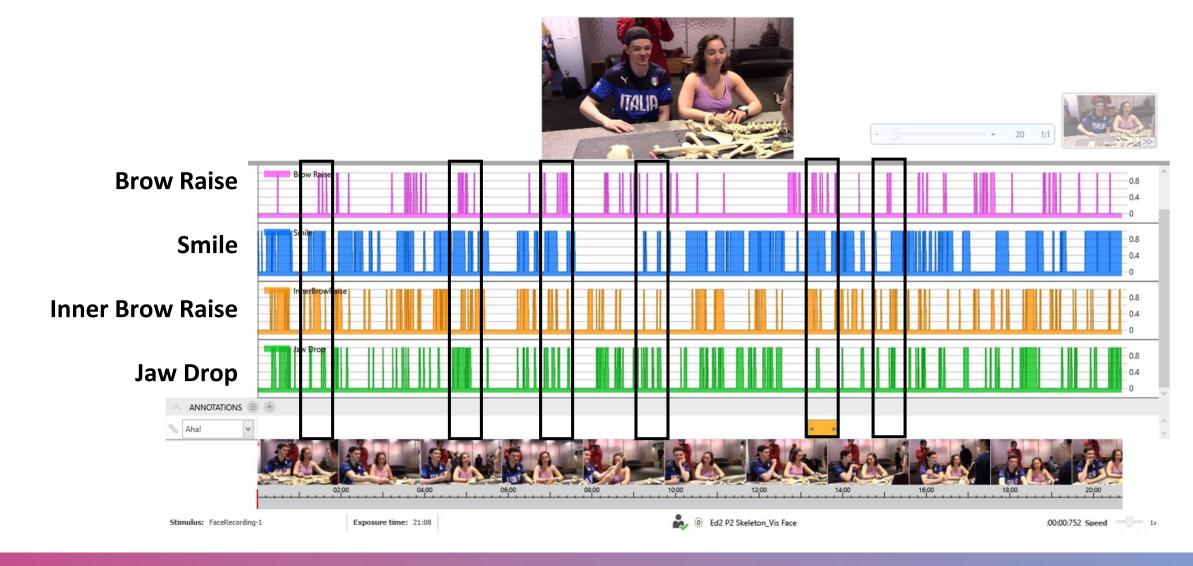

**Visitor**: "I felt very connected... the educator went with what we were going with... the flexible structure helped."

Educator: "It was one of my best programs... the visitor had a goal in mind, they were curious, and were very excited."

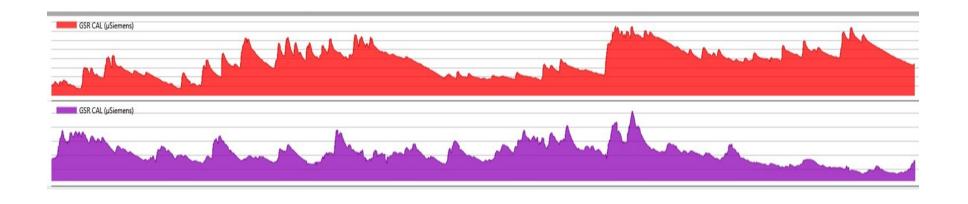

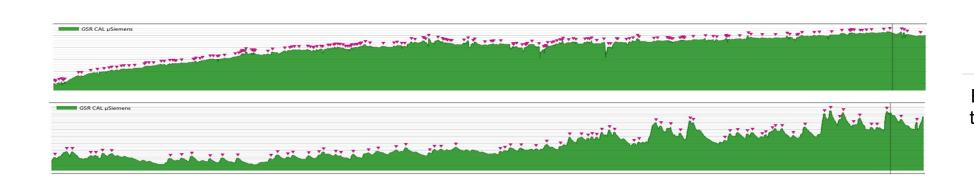

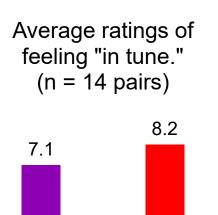

### What else did we learn?

### What else did we learn?

### What else did we the educator learn?

"I do think seeing this data helps me confirm that I have a good read on how things are going, ... and I can be harsh on myself ... but that overall people tend to have a really positive experience ... And that the emotions do play off of each other. That's something I thought of, but looking at the plots and sequences it's more obvious than I would have thought."

"This is more information than I'd get from a typical interaction... It confirms what I was thinking, but gives more context, like [another visitor said] 'I was a bit confused' ... but I thought he was just bored. ... Maybe I could stop and ask more questions. ... What are ways I can be supportive?"

Design Challenge: Bees

### **Bees Topics**

- 1. Bees: Bio-inspired design
  - Possible topics: robotic bees for surveillance, robotic bees for pollination, honeycomb structure strength
- 2. Bees: Indicators of environmental health
  - Possible topics: Colony collapse disorder, bee's role in ecosystems, pesticide interactions
- 3. Bee-human interfaces
  - Possible topics: bee sting allergies, arthritis treatments, benefits of local honey
- 4. Bee society as a model for human politics
  - Possible topics: gender, hierarchy, caste, worker roles

### Acknowledgments

This workshop is supported by a grant to the Museum of Science, Boston from the National Science Foundation under award #1612577 and a grant to the Museum of Science, Boston from the Argosy Foundation.

### Emotion 101 Glossary of Terms

Emotion

biological and psychological processes that result in the experience of feeling, with impacts on thought and behavior

**Core Affect** 

The basic sense of how your body feels that can be described by valence and arousal. It is distinct from emotion which is a complex mental construction.

Valence

The sense of how positive or negative a feeling is, from unpleasant to pleasant.

**Activation/ Arousal** 

The amount of energy associated with a feeling. For example, heightened physiological activity might be described as agitation, lower activity as calm.

Gestalt

A sense of how you feel taken a whole.

Productive Struggle

An experience when a learner engages with disequilibrium in order to navigate a challenging task and achieve a satisfying resolution.

Disequalibrium

A sense of imbalance, which can be experienced as confusion, frustration, surprise, or unease.

Emotions	So we can characterize emotions by	"Cheat Sheet" Notes:	e.g.
( <b>A</b> )are continuously experienced	asking people how they feel at different points during an experienceasking people how they felt at different points in an experience afterward (preferably soon after)asking people how they felt about an experience as an overall assessment (gestalt experience).	. 3,	[1, 2, 3, 4]

### **Characterizing an Emotion Experience – Data Collection Protocol**

I'm interested in learning about the emotions you felt as you were doing the Scaling Shapes activity. One way to think about emotion is that it has two parts. One part is how much energy you feel, shown on this line [point to energy scale], and that can range from low (or calm) to high (or energized). The other part is how negative (or bad) to positive (or good) you feel [point to valence scale].

Think about how you felt when you felt when you from negative (0) to positive (10)	ou <b>first started</b> the Scaling Shapes activity. H ? <b>Respons</b> e:	low would you rate your feelings,
